GCC Edition

VERICARGO ONETRUTH

Governed Supply Chain Ontology and Exception Copilot

One shipment. Two destinations. One governed truth.

Challenge: Supply Chain Ontology and Governed Conversational Analytics

Team: VeriCargo | Team lead: [ADD NAME] | Team size: [ADD NUMBER]

01 | BUSINESS PROBLEM

Fragmented truth blocks timely action

ERP says delivered. The Shipping Instruction says Vietnam. The Draft Bill of Lading says Thailand. Which version should the business trust?

FRAGMENTED SOURCES

ERP, logistics, inventory, cost and shipping documents sit in separate systems with inconsistent identifiers.

INCONSISTENT METRICS

Operations, procurement and planning can receive different answers for the same delivery-performance question.

UNSAFE EXCEPTIONS

Missing, unreadable or ambiguous evidence is often guessed, ignored or handled through untracked manual follow-up.

TARGET USERS

Logistics control tower | Procurement | Planning | Document operations

ONE GOVERNED ROUTE

Detect contradiction -> preserve evidence -> explain with governed AI -> human-confirm action -> audit outcome

02 | SNOWFLAKE-NATIVE SYSTEM DESIGN

Connected evidence-to-action architecture

CoCo builds and verifies the solution; Snowflake runs the governed production workflow.

03 | GOVERNED CONVERSATIONAL ANALYTICS

One metric, three personas, one answer

OPERATIONS

"What is our on-time delivery rate for completed shipments?"

PROCUREMENT

"What is supplier delivery compliance against promised dates?"

PLANNING

"What percentage of delivered shipments arrived on or before promise?"

60.0%

3 on time / 5 delivered

Shipment grain | Same all-delivered window | Same governed definition

Canonical OTD = delivered shipments on or before promise / delivered shipments

Verified by three independent Agent questions; evidence query IDs are retained in COCO_USAGE.md.

04 | SHP-1002 END-TO-END PROOF

One shipment. Two destinations. One governed decision.

CONFLICTING SOURCE EVIDENCE

Finding	Shipping Instruction	Draft BL / Actual
Destination	VNSGN	THLCH
Gross weight	8,000 kg	7,800 kg
Delivery	Promised	1 day late
Sources	doc-shp-1002-si.pdf doc-shp-1002-bl.pdf	

Result: two linked governed exceptions

1

DETECT

Late delivery + document mismatch

2

EVIDENCE

Raw, normalized, confidence, filenames

3

EXPLAIN

Agent answer is cited and read only

4

CONFIRM

Cancel = 0 writes; Confirm = 1 case

5

AUDIT

RC-000201, 2 links, 3 lifecycle events

Agent proposes. Human confirms. Every mutation is audited.

05 | REQUIRED TOOLING AND INGENUITY

CoCo CLI across the complete delivery lifecycle

CoCo is the engineering copilot used to plan, build, execute, test and automate the solution - not a runtime dependency.

**FAILED-THEN-FIXED EVIDENCE**

Busan initially normalized incorrectly -> CoCo repaired SQL alias parity -> all aliases and six document outcomes passed regression.

06 | IMPACT AND SUBMISSION READINESS

Working MVP, measurable proof, scalable governed core

30/30

Local tests

28/28

Snowflake checks

60.0%

Consistent OTD

2

Linked findings

3

Audit events

WHAT THE MVP PROVES

- Structured metrics and unstructured documents share one shipment context
- Failed or ambiguous extraction stays unresolved
- Unknown IDs, duplicate cases and illegal transitions are blocked
- Six connected pages preserve investigation context

HOW IT EXTENDS

Replace synthetic ingestion with live ERP, TMS, WMS, carrier, Gmail or extension connectors. The ontology, semantic definitions, evidence model, Agent guardrails, review workflow and audit layer remain reusable.

Provenance: all submitted business data is synthetic. The prior Chrome extension is disclosed background IP and is outside this runtime.
